

# ILLNESS SIMULATION 6

## Simulation focus - Anaphylaxis (Surgical airway - discussion)

### Expected outcomes

**Team Leader** - Perform initial ABCDE assessment, direct team and lead care. Recognises anaphylaxis and instigates appropriate management as per the algorithm. Recognises ongoing deterioration including threatened airway and escalates whilst administering further adrenaline.

**Team/More experienced candidate** - Recognises loss of airway and refractory anaphylaxis. Is able to discuss various forms of front of neck access including surgical airway.

### Assessment

This simulation allows for discussion around surgical airways.

### History

#### Emergency staff:

You have had a pre-alert from a non-paramedic crew bringing in Lou, a three-year-old child, known to be allergic to peanuts. They attended a friend's birthday party and after eating part of a chocolate bar, vomited once and developed a widespread urticarial rash. The ambulance crew are concerned as they appear drowsy with swollen lips.

#### Ward staff:

You are called to review a three-year-old child, Lou on the paediatric ward. Shortly after receiving their first dose of IV antibiotics for cellulitis the FY1 noted a widespread urticarial rash that they think might be an allergic reaction. The cannula has subsequently tissueed and been removed.

### Immediately apparent

Please ensure the prompt card with global overview is placed on the manikin for the start of the sim.

*As you approach the child you can clearly see evidence of a widespread urticarial rash and lips appear to be full.*

*For the **ward case**, cellulitis is noted on the left leg and remains within a previously demarcated area.*

### Clinical course (to be given as the simulation progresses)

| Assess | Features  | Action  | Key treatment points  |
|--------|---|---|---|
| A      | Mild-moderate facial swelling   | Assess, establish airway currently patent but potentially threatened. Oxygen administered   | <b>IM adrenaline (150mcg)</b><br>Ask for help               |
| B      | <b>RR 38</b> with laboured breathing. Equal air entry. Mild generalised wheeze throughout.<br><b>SpO<sub>2</sub> 92% on room air.</b> | Assess including auscultation and SpO <sub>2</sub> . Recognised increased effort but no LRTI signs. Administer O <sub>2</sub> if not already. | High flow oxygen via non-rebreathe face mask                |
| C      | <b>HR 140, CRT 2, BP 79/38</b>  | Assess and recognise compensated shock.   | <b>IV/IO access</b><br>Bloods<br><b>10ml/kg fluid bolus</b> |
| D      | Responds to voice,<br><b>GCS 14 (E3V5M6).</b><br><b>BM 6.7</b> Pupils 4mm, reflexes brisk.  | Assess  | Check blood glucose   |

|   |  |        |  |
|---|--|--------|--|
| E | Widespread urticarial rash as described, facial swelling. <b>Temp 37.1°C</b> | Assess |  |
|---|--|--------|--|

## Reassessment

The candidate then begins to hear a strange noise prior to re-assessment.

| Assess | Features   | Action  | Key treatment points   |
|--------|--|---|--|
| A      | Stridor and worsening lip swelling noted   | Assess, recognises deteriorating airway   | <b>2<sup>nd</sup> dose of IM adrenaline (150mcg)</b><br>Nebulised adrenaline may be given (5ml 1:1000)<br><b>Urgent escalation to anaesthetics</b> |
| B      | <b>RR 25</b> with laboured breathing. Equal air entry. Stridor plus mild generalised wheeze throughout.<br><b>SpO<sub>2</sub> 91%</b> on high flow oxygen. | Assess including auscultation and SpO <sub>2</sub> . Recognised increased effort but no LRTI signs. Administer O <sub>2</sub> if not already<br>2 helpers arrive at the end of this section | High flow oxygen via face mask   |
| C      | <b>HR 153, CRT 3-4, BP 71/32</b>   | Assess and recognise decompensated shock. Consider refractory anaphylaxis algorithm /treatments   | <b>10ml/kg fluid bolus</b><br>Bloods<br>Consider potential need for adrenaline infusion should patient not respond to 2 <sup>nd</sup> IM dose.     |
| D      | Responds to pain, <b>GCS 12</b> (E3V4M5). Pupils 4mm, reflexes brisk. <b>BM 6.7</b>  | Assess and recognise decreased consciousness due to exhaustion (or possible hypercapnia)  |  |
| E      | Widespread urticarial rash as described, facial swelling. <b>Temp 37.1°C</b>   |   |  |

## Reassessment

As Candidate ends reassessment the child begins to become extremely agitated, saturations drop. There is still cardiac output.

| Assess | Features  | Action   | Key treatment points  |
|--------|---|--|---|
| A      | Quiet stridor, cyanotic. Facial and tongue swelling ++++. See-saw abdomen. Airway <b>not</b> patent | Assess<br>May trial NPA/OPA/SAD however NPA will make no difference and child will resist insertion of OPA/SAD | Recognises upper airway obstruction necessitating front of neck access<br><b>Sim ends at this point</b> |

|           |   |
|-----------|---|
| <b>NB</b> | <p>This station aims to review the anaphylaxis and refractory anaphylaxis algorithms as well as ensuring the candidate can recognise the airway at threat and obstructed airway. Other suggestions for treatment may be made (i.e., salbutamol/steroids/antihistamines) and it is within your discretion whether they are given and make no difference or are still being located and so are not administered.</p> <p><b>If the candidate fails to appreciate the critical airway obstruction on reassessment and need for surgical airway, the insider should suggest it otherwise the patient will deteriorate until it is recognised.</b></p> <p>If RSI is suggested, it would be reasonable for faculty helper (or other faculty member) to act out this with the outcome being a “can’t intubate and can’t ventilate” scenario. The candidate could then be questioned on what should be done – front of neck, and the sim ends.</p> |
|-----------|---|

### Debrief

Using the learning conversation, discuss the technical and non-technical elements of the simulation

### Assessment

This station makes up part of the continuous assessment process, therefore candidates need to know whether they are meeting the standard.

At the end give the opportunity for candidates to ask questions, answer these and then summarise the key points.

**Illness 6 - Global overview (to be placed on SIM manikin) - ED**

**The child has a widespread urticarial rash.**

**They have very full lips.**

**Illness 6 - Global overview (to be placed on SIM manikin) - Ward**

**The child has a widespread urticarial rash.**

**They have very full lips.**

**Cellulitis is noted on the left leg and remains within a previously demarcated area.**

**Illness 6 - Results Information**

Venous Blood Gas – taken during first assessment  
and given if requested

|                               |                             |
|-------------------------------|-----------------------------|
| pH                            | 7.19                        |
| PO <sub>2</sub>               | 8.1 (FiO <sub>2</sub> 0.21) |
| pCO <sub>2</sub>              | 6.9                         |
| HCO <sub>3</sub> <sup>-</sup> | 18                          |
| BE                            | -7                          |
| Na                            | 138                         |
| K                             | 5.3                         |
| Ca (ionised)                  | 1.2                         |
| Lacate                        | 3.3                         |

BM 6.7

## Faculty Helper Information – Illness 6

When candidate requests information regarding observations please give the following in “real-time” (e.g., wait for blood pressure to cycle, saturation trace to be achieved). If key treatment points are not undertaken, consider a “prompt” that would be visible in a child.

| Assess | Observation   | Example prompt  |
|--------|---|---|
| A      | Mild-moderate facial swelling   | “Do you think her face usually looks like that?”                  |
| B      | <b>RR 38</b> with laboured breathing. Equal air entry. Mild generalised wheeze throughout.<br><b>SpO<sub>2</sub> 92% on room air.</b> | “She’s breathing quite hard, isn’t she?”<br>“Sounds a bit wheezy” |
| C      | <b>HR 140, CRT 2, BP 79/38</b>  | If “bloods” prompt and ask which ones                             |
| D      | Responds to voice,<br><b>GCS 14</b> (E3V5M6).<br><b>BM 6.7</b> Pupils 4mm, reflexes brisk.  |   |
| E      | Widespread urticarial rash as described, facial swelling. <b>Temp 37.1°C</b>  | “I don’t like the look of that rash”                              |

## First Reassessment – Illness 6

| Assess | Observation  | Example prompt  |
|--------|--|---|
| A      | Stridor and worsening lip swelling noted   | “I think her face is getting worse, do you want anything else?”<br>“What’s that noise?” |
| B      | <b>RR 25</b> with laboured breathing. Equal air entry. Stridor plus mild generalised wheeze throughout.<br><b>SpO<sub>2</sub> 91%</b> on high flow oxygen. | “She’s breathing quite hard, isn’t she?”<br>“Oxygen is still attached”                  |
| C      | <b>HR 153</b><br><b>CRT 3-4</b><br><b>BP 71/32</b>   | “Do you want more fluids?”  |
| D      | Responds to pain, <b>GCS 12</b> (E3V4M5). Pupils 4mm, reflexes brisk. <b>BM 6.7</b>  | “She looks a bit tired, doesn’t she?”   |
| E      | Widespread urticarial rash as described, facial swelling.<br><b>Temp 37.1°C</b>  |   |

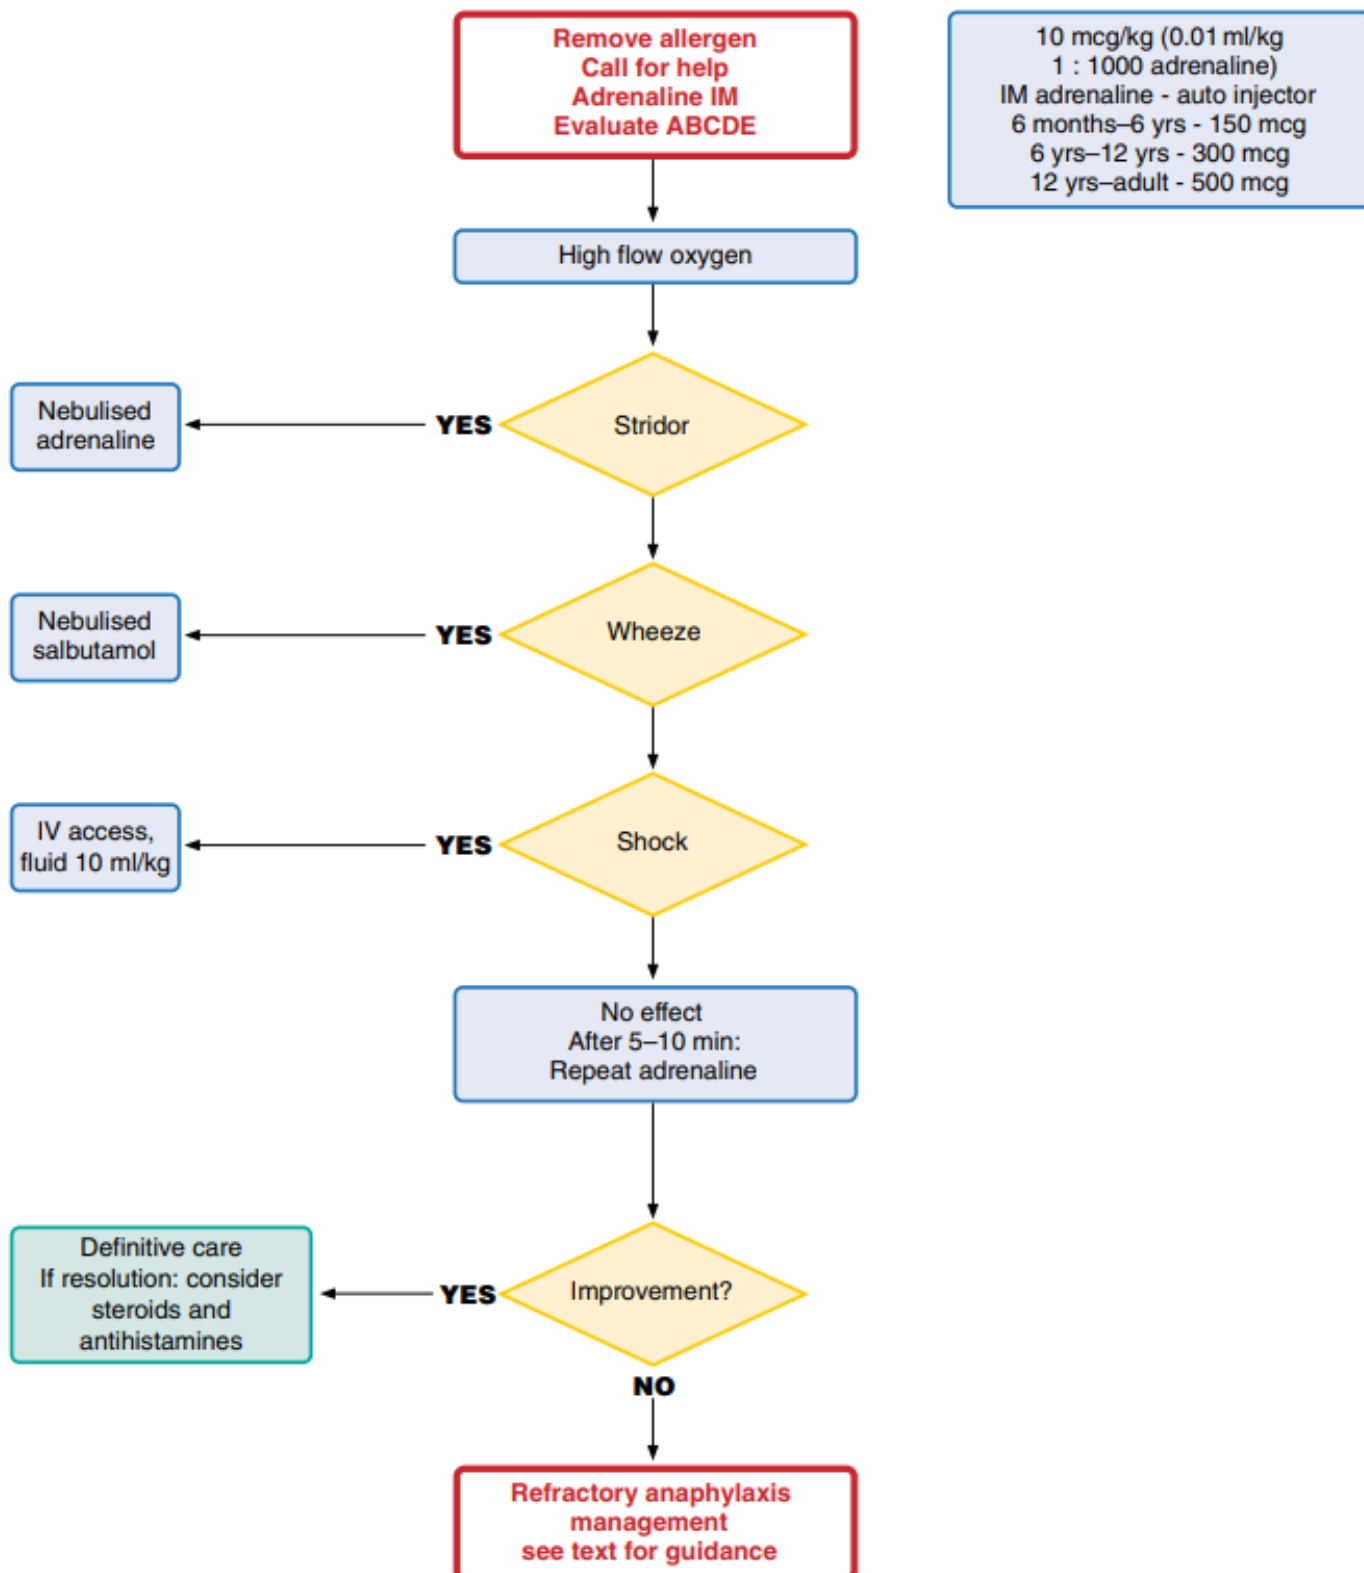

## Second Reassessment – Illness 6

| Assess  | Observation   | Example prompt  |
|---|---|---|
| A   | Quiet stridor, cyanotic.<br>Facial and tongue swelling +++.<br>See-saw abdomen.<br>Airway <b>not</b> patent | “Is she still breathing?”<br>“Oxygen is still attached”<br>“What else can we do?”<br>“I think you need more help”<br><b>“I think she needs a surgical airway”</b> |
| If RSI is suggested, it would be reasonable for faculty helper to act out this with the outcome being a “can’t intubate and can’t ventilate” scenario. The candidate could then be questioned on what should be done – front of neck, and the sim ends. |   |   |

## Algorithms:

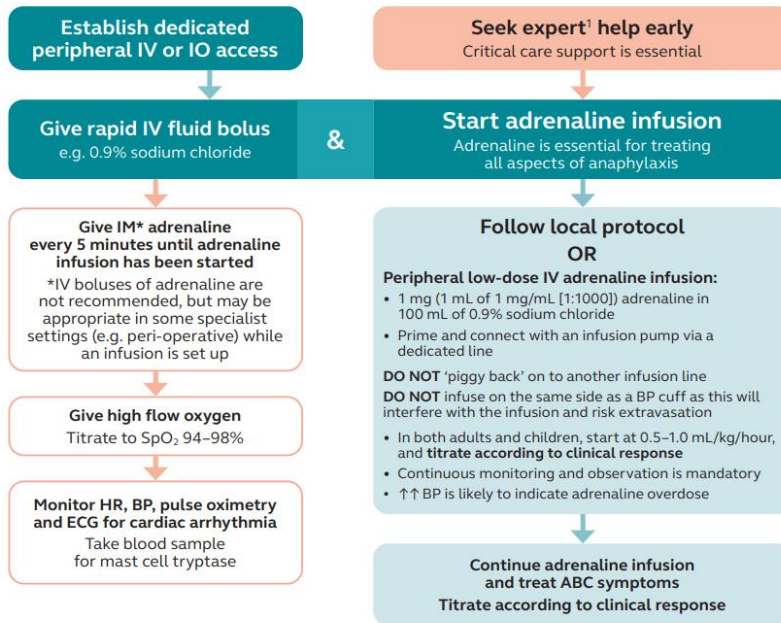

Anaphylaxis  
Refractory Anaphylaxis

# APLS: Emergency treatment of anaphylaxis

## Refractory anaphylaxis

No improvement in respiratory or cardiovascular symptoms despite 2 appropriate doses of intramuscular adrenaline

<sup>1</sup>Intravenous adrenaline for anaphylaxis to be given only by experienced specialists in an appropriate setting.

### A = Airway

Partial upper airway obstruction/stridor:  
Nebulised adrenaline (5mL of 1mg/mL)  
Total upper airway obstruction:  
Expert help needed, follow difficult airway algorithm

### B = Breathing

Oxygenation is more important than intubation  
If apnoeic:  
• Bag mask ventilation  
• Consider tracheal intubation  
Severe/persistent bronchospasm:  
• Nebulised salbutamol and ipratropium with oxygen  
• Consider IV bolus and/or infusion of salbutamol or aminophylline  
• Inhalational anaesthesia

### C = Circulation

Give further fluid boluses and titrate to response:  
Child 10 mL/kg per bolus  
Adult 500–1000 mL per bolus  
• Use glucose-free crystalloid (e.g. Hartmann's Solution, Plasma-Lyte®)  
Large volumes may be required (e.g. 3–5 L in adults)  
Place arterial cannula for continuous BP monitoring  
Establish central venous access  
IF REFRACTORY TO ADRENALINE INFUSION  
Consider adding a second vasopressor in addition to adrenaline infusion:  
• Noradrenaline, vasopressin or metaraminol  
• In patients on beta-blockers, consider glucagon  
Consider extracorporeal life support

### Cardiac arrest – follow ALS ALGORITHM

- Start chest compressions early
- Use IV or IO adrenaline bolus (cardiac arrest protocol)
- Aggressive fluid resuscitation
- Consider prolonged resuscitation/extracorporeal CPR

## Further emergency management

For anaphylaxis features that do not respond to initial IM adrenaline, continue with a bolus of balanced crystalloid and/or ventilatory support, and give a second dose of IM adrenaline 5 minutes after the first. If the reaction does not respond to two doses of IM adrenaline, commence **refractory anaphylaxis management**. Give a rapid fluid bolus and commence an IV/IO adrenaline infusion according to local guidelines and titrate to clinical response. While waiting for the infusion to be prepared, continue IM adrenaline every 5 minutes.

The child should be closely monitored with continuous pulse oximetry, blood pressure and ECG. If the shock is refractory to the adrenaline infusion a second vasopressor, such as noradrenaline, vasopressin or metaraminol, could be considered. Guidance from a paediatric intensive care specialist is vital.

Take a blood sample for mast cell tryptase for future analysis as soon as possible, and a second sample 2–4 hours later.

In addition to this treatment, corticosteroids (e.g. hydrocortisone) are still recommended for refractory reactions. The role these drugs have in acute management is limited, as their onset of action is too delayed to be of much benefit in the first hour.

In cardiac arrest, resuscitation should be aggressive – do not give up too soon. Prolonged cardiopulmonary resuscitation, including extracorporeal membrane oxygenation (ECMO), should be considered as the cause of arrest is potentially reversible and the tissue oxygenation prior to arrest is likely to have been normal.
